

JOSE LUIS MONTEZA MILIAN

BACKEND / FULL-STACK DEVELOPER — .NET (C#) · REACT · TYPESCRIPT

Lima, Peru (GMT-5, overlaps US time zones) · **Seeking:** Backend or Full-Stack .NET — remote (LATAM contractor or full-time)

Email: joseluismontezamilian12@gmail.com · **Phone / WhatsApp:** +51 913 504 270

LinkedIn: linkedin.com/in/joseluismonteza · **GitHub:** github.com/joseluismontezamilian12-rgb

Portfolio: joseluismontezamilian12-rgb.github.io/portafolio-frontend · **Live API:** supplychaincore-api-lnxj7c.azurewebsites.net

PROFESSIONAL SUMMARY

Backend-focused full-stack developer in C#/.NET 10 and React/TypeScript: REST APIs with Clean Architecture, EF Core, JWT/RBAC security and unit testing with xUnit and Moq. Systems Engineering student who moved into software after 3+ years leading retail operations teams, so my projects attack problems I have owned first-hand — inventory control, shrinkage and demand planning. Most recent: automating the daily production-allocation decision across a 7-kitchen network — a TypeScript engine with **176 automated tests**, validated against real order data.

CORE SKILLS

- **Languages:** C#, TypeScript, JavaScript (ES6+), SQL, HTML5, CSS3
- **Backend:** .NET 10 / .NET 8, ASP.NET Core Web API, Minimal APIs, Entity Framework Core, REST API design, Clean Architecture, Repository Pattern, DTOs, LINQ, async/await, SOLID, JWT authentication, role-based authorization (RBAC), PBKDF2 password hashing, service-to-service HTTP integration
- **Frontend:** React 19, Vite, Recharts, responsive design
- **Databases:** SQL Server, Azure SQL, Redis, EF Core Migrations, relational data modeling, data seeding
- **Testing & Quality:** xUnit, Moq (unit testing, dependency mocking), Swagger / OpenAPI, CI with GitHub Actions
- **Tools & Practices:** Git, GitHub, GitFlow, CI/CD, Docker, Visual Studio, VS Code, Agile / Scrum
- **AI-assisted engineering:** GitHub Copilot, Cursor, Claude Code, prompt engineering
- **Business systems:** SAP (inventory & logistics), Kronos (workforce management)

ENGINEERING PROJECTS

SupplyChainCore — Inventory & Supply Chain System (Full-Stack)

github.com/joseluismontezamilian12-rgb/SupplyChainCore-FullStack

Live API + Swagger: supplychaincore-api-lnxj7c.azurewebsites.net

Stack: C# / .NET 10, ASP.NET Core Web API, EF Core, Azure SQL, JWT, React + Vite, Recharts, xUnit, Moq, Docker, Azure App Service

- **Immutable transactional ledger for inventory:** validates stock in real time and rejects any operation that would create a negative balance before persisting — enforced in the service layer, never in the UI.
- **JWT authentication with role-based authorization:** passwords hashed with PBKDF2-HMAC-SHA256 (100k iterations, per-user salt, constant-time comparison); ledger writes restricted to the *Admin* role, and movement authorship read from the token claim rather than the request body, so no client can sign a movement in another user's name.
- Clean Architecture across four projects (Domain / Application / Infrastructure / WebApi) with Repository Pattern, DTOs and EF Core migrations, plus a React dashboard on the analytics endpoints; **57 unit tests** (xUnit + Moq) over ledger rules, hashing, token issuance and login, run by CI on GitHub Actions on every push.

Merma AI — Inventory & Shrinkage Control for Food Retail (React SPA)

github.com/joseluismontezamilian12-rgb/merma-ai · Live demo: joseluismontezamilian12-rgb.github.io/merma-ai

Stack: React 19, Vite, localStorage, GitHub Pages

- **Built for a real store and piloted there** against its full **78-SKU** catalog while I managed it — the public repo ships a sanitized demo dataset.
- Order-cycle-aware recommendations: real consumption per product (ordered – shrinkage) minus current stock, with per-order justification; shrinkage ledger and shelf-life alerts. Deterministic, explainable logic — no black box.

ECommerceEcosystem — Distributed Backend (Catalog + Basket Services)

github.com/joseluismontezamilian12-rgb/ECommerceEcosystem · Live: ecommerce-catalog-lnxj7c.azurewebsites.net · ecommerce-basket-lnxj7c.azurewebsites.net

Stack: C# / .NET 10, ASP.NET Minimal APIs, EF Core, Azure SQL, Redis, Swagger, Azure App Service

- Two independently deployable services — Catalog.API (Azure SQL) and Basket.API (Redis) — communicating over synchronous HTTP; immutable *records* as domain entities and DTOs to decouple contracts. **Both deployed and open to public testing**, with migrations applied on startup behind a configuration flag.
- **Server-side price verification:** the basket re-fetches every item from the catalog service and overwrites the name and price supplied by the client before persisting. Post a 1,200 laptop priced at 1.00 and the API answers 1,200 — client-side price manipulation never survives the round trip.

PROFESSIONAL EXPERIENCE

Manzana Verde — Operations Coordinator, Lima

Jul 2026 – Present

Food-tech: healthy meal plans · 1.4M+ orders · Peru, Mexico, Colombia

- **Automated the daily production-allocation decision** for a network of **7** partner kitchens — until then made by hand. **Impact quantified against 25 days of real order data; figures not yet cleared for publication and discussed in interview.**
- Each kitchen is scored on operational performance and demand is routed by district adjacency under hard capacity caps, with every assignment traceable to the inputs that produced it.
- Built as a reusable **TypeScript** library exposed through a CLI, an API and a web screen, with **176 automated tests**; Operations tunes capacity, adjacency and demand in editable files without a deployment — a working proof of concept, pending rollout.
- Coordinate daily production and delivery operations across the kitchen network: capacity planning, SLA compliance, and quality-incident follow-up.

Pickadeli (MANQA Inversiones S.A.C.) — Store Manager, Lima

Apr 2026 – Jul 2026

Fast-casual salad chain

- **Built and piloted "Merma AI"**, a self-developed React tool, against the store's real **78-SKU** catalog — cross-checking warehouse stock, orders and shrinkage to recommend next-order quantities from real consumption history.
- Ran daily store operations on POS / back-office systems with a **15-person** team: inventory control, shrinkage audits, and sales-KPI reporting.

Retail & Food Service Operations — Store & Section Management, Lima

May 2019 – Apr 2026

Boba Station (Boba Enterprises S.A.C.) · Plaza Vea (Compañía Food Retail S.A.C.) · Ten Ren Bubble Tea · Chinawok / Bambos · COESTI "Listo" · Alert del Perú · Metas Perú

- **Store Manager, Boba Station** (Oct 2025 – Apr 2026) and **Section Manager, Plaza Vea** (Mar – Sep 2025): full ownership of sales KPIs, cash control and inventory, leading teams of **15 to 30** people across shifts.
- **Automated the operational data flows** of the store — daily sales, inventory, shrinkage and management reports — replacing manual consolidation with structured, repeatable workflows.
- Led logistics and operational audits for a supermarket section handling **thousands of SKUs**; preventive analysis of system movements to stop pre-inventory variances.
- Daily work on **SAP** (shrinkage logging, real-time inventory) and **Kronos** (workforce scheduling); earlier supervisor and operations roles across food service and convenience retail.

EDUCATION

- **B.Eng. Systems Engineering — Universidad Privada del Norte (UPN), Lima** · 2024 – present (6th semester, expected 2028). Relevant coursework: Software Design & Architecture, Advanced Data Structures, Advanced Databases, Agile Methodologies.
- **Accounting (technical program) — Certus, Lima** · completed through 5th semester.

LANGUAGES

- **Spanish** — Native
- **English** — Intermediate (B1), async-first: fully comfortable in written English (pull requests, documentation, tickets, daily technical reading); conversational speaking, actively improving.
